WEEK 1 DAY 2

Internship Program — Batch 2026

Submitted By:	Muhammad Daim
Department:	Pvthon Programming
Submitted To:	Mohazin Zahid
Date:	10 july 2026

1. Introduction

This report covers a basic Python program that demonstrates variables and data types. It shows how to store different kinds of values and how to check the type of each using the `type()` function.

2. Program — Variables and Data Types

The program creates three variables — a name, an age and a CGPA — prints their values, and then prints the data type of each.

2.1 Code

```
name = "Daim"  
age = 20  
cgpa = 3.5  
print(name)  
print(age)  
print(cgpa)  
print(type(name))  
print(type(age))  
print(type(cgpa))
```

2.2 Output

```
Daim  
20  
3.5  
<class 'str'>  
<class 'int'>  
<class 'float'>
```

3. Explanation

The program uses three different data types:

- name holds text, so its type is `str` (string).
- age holds a whole number, so its type is `int` (integer).
- cgpa holds a decimal number, so its type is `float`.

The `type()` function returns the data type of a value, which is why the last three lines print `<class 'str'>`, `<class 'int'>` and `<class 'float'>`.

4. Conclusion

This program practised the basics of Python variables and data types — storing string, integer and float values and checking each with `type()`. The program ran successfully and produced the expected output.
